

The U.S. Environmental Protection Agency (EPA) lists pet waste as a significant source of non-point pollution.

Pet waste left on lawns, curbs, sidewalks, and streets can wash into local waterways during a rainstorm. Remember, stormwater currently receives no treatment.

Water that flows into your stormwater drainage system goes **directly** into our bayous, rivers, and bays.

Please pick up after your pet!

## Montgomery County MUD 94

It's estimated that an average dog produces three-quarters of a pound of waste each day. That's over 270 pounds of waste every year. Unlike wild animals that might establish a territory of 12 square miles to 1,000 square miles, our canine friends generally walk where humans lead them. It's easy to see that walking a dog on the same route, day after day, without waste pickup leads to a lot of accumulated waste.

# ONLY RAIN DOWN THE DRAIN!
